## PART I.

### Genus I. PITYLUS.

*Pitylus*, Cuv. Regn. An. 1829, ii. p. 413.

*Cissurus*, Reich. Av. Syst. Nat. pl. 77.

*Periporphyrus*, Reich. l. c.

*Caryothraustes*, Reich. l. c.

*Rostrum maximum, breve, altum, latum, quasi coccothraustinum; mandibulæ superioris marginibus fortiter sinuatis et mandibulam inferiorem tegentibus; culmine multum incurvo: alæ modicæ, remigibus tertia, quarta et quinta longissimis: cauda plus minusve elongata, plerumque rotundata: tarsi robusti.*

The birds of this genus are the most finch-like of the Tanagers, and I have some doubts whether they are not as closely allied to *Guiraca*, *Hedymeles*, and other *Coccothraustine* forms, as to the present group. We want more information as to their habits and internal structure before this point can be satisfactorily settled.

*Hab.* South Brazil, Bahia (*J. Verreaux*).

*Mus.* Paris., Brit., Berol., &c.

This curious bird has long been common in European collections, being often transmitted from Bahia. From its appearance one would suppose it to be a female, but M. Jules Verreaux (who has himself shot it in the island of Itaparica) informs me that the natives consider it a distinct species.

Lesson's description of his *Pyrrhula abeillei* " *corpo isabellino : occipite, dorso et cauda supra brunneo-isabellinis : infra fronte et collo latè isabellinis : alarum pennis nigris extus rufis,*" is, I think, sufficiently accurate to warrant us using his specific name for this bird.

*Hab.* South-east Brazil, prov. San Paolo (*Licht.*); Minas and Bahia (*P. Max.*).

*Mus.* Brit., Paris., Derbiano.

This bird differs from the members of the genus *Orchesticus*, with which it has been lately associated, in the smaller straighter bill, very short wings, and more squared tail.

#### 2. DIUCOPIS SPECULIGERA.

*Schistochlamys speculigera*, Gould, P. Z. S. 1855, p. 68, et Ann. N. H. xv. p. 345.

*Nigra: speculo alarum, tectricibus subalaribus et macula sub nucha pennis obtecta cum corpore subtus albis: lateribus et dorso postice schistaceis.*

*Hab.* East Peru, river Ucayali (*Hawawell*).

*Mus.* Brit.

p. 69

7

Mr. Gould's types are the only specimens I have seen of this peculiar bird. They were collected by Mr. Hawxwell in August 1852 upon the Ucayali, and are marked "Irides red." I rather doubt this being the true place of this species, but at present I am unable to indicate a better one.

#### Genus IV. SALTATOR.

*Saltator*, Vieillot, Analyse, p. 32 (1816).

*Rostrum forte, elongatum, incurvum, vix sinuatum sed apice dentata: alæ rotundatae, remigibus tertia, quarta et quinta fere aequalibus et longissimis: cauda admodum longa et plerumque rotundata: ptilosis olivacea, schistacea, fulva, brunnea: sexus similes.*

##### 1. SALTATOR ATRICEPS.

*Saltator atriceps*, Less. Cent. Zool. pl. 69; Gray, Gen. p. 363; Bp. Cons. p. 489; Cab. M. H. p. 142.

*Arremon giganteus*, Bp. P. L. Z. 1837, p. 117; Gray, Gen. p. 361.

*Pyrrhula raptor*, Cabot, Boston Journ. v. p. 90.

*Saltator raptor*, Gray's Gen. App. p. 16; Bp. Notes s. l. coll. Delattre, p. 23.

*Flavo-olivaceus: capite toto cum mento et vitta cervicem anticam cingente nigris: superciliis a fronte curtis et plaga guluri media albis: abdomine cinereo, crissso ochraceo-rufo.*

Long. tota 9·5, alæ 4·7, caudæ 4·7.

Hab. South Mexico, Papantla (*Deppe*); vic. of Cordova (*Sallé*); Guatimala (*Bp.*); Escuintla (*Mus. Brit.*); Yucatan (*Cabot*).

*Mus. Brit.*, Parisiensi, &c.

This is the largest and finest species of the genus. Prince Bonaparte (Notes Orn. s. l. coll. Delattre, p. 23) seems to consider Dr. Cabot's *Pyrrhula raptor* distinct, but Mr. Cassin, in his communication on Dr. Cabot's birds given in 'Jardine's Contributions,' 1852, p. 96, states it to be identical with the present bird, and the description given by Prince Bonaparte is applicable in every respect to this species.

##### 2. SALTATOR MAGNOIDES.

*Saltator magnoides*, Lafr. R. Z. 1844, p. 41; Gray, Gen. App. p. 10; Bp. Cons. p. 489.

*Saltator gigantodes*, Cab. M. H. p. 143.

*Supra olivaceus; capite cinereo, pileo viridi mixto: subtus schistaceus, mento albo, gutture et crissso ferrugineis: vitta lata gutturem undique cingente nigra.*

Long. tota 7·5, alæ 4·0, caudæ 3·6.

Hab. Mexico (*Lafr.*); vic. of Cordova (*Sallé*); Coban (*Mus. Brit.*); Chiriqui (*Bridges*).

*Mus. Brit.* et Heineano.

The *S. magnoides* is very like the preceding species but much smaller in size, and with but slight supercilia. Besides, the chin is

*p 70*  
white and the throat brown like the *crissum*. I have seen the type of *S. gigantodes* in Herr Heine's museum, and consider it the same as *magnoides*.

### 3. SALTATOR MAGNUS.

*Tangara des grands bois de Cayenne*, Buff. Pl. Enl. 205 (fig. pess.).

*Tanagra magna*, Gm. S. N. p. 890; Lath. Ind. Orn. i. p. 422; Max. Beitr. iii. 525.

*Le grivard de Cayenne*, Buff. Pl. Enl. 616 (fig. pess.)?

*Coracias cayana*, Bodd. Table d. Pl. Enl.

*Coracias cayennensis*, Gm. S. N. p. 381.

*Saltator virescens*, Vieill. Nouv. Dict. xiv. 104, et Enc. Méth. p. 790?

*Saltator olivascens*, Vieill. Nouv. Dict. xiv. 108; Enc. Méth. p. 794, et Gal. des Ois. p. 103, pl. 77; Tsch. F. P. p. 209.

*Saltator cayennensis*, d'Orb. Voy. p. 290.

*Saltator magnus*, Gray's Gen. p. 363; Bp. Consp. p. 489; Cab. Mus. Hein. p. 142.

*Supra flavescens-olivaceo-viridis, capitis lateribus cinereis, supercilii ante oculos curtis albis: subtus fulvescenti-cinereus: gula media alba, utrinque nigro-marginata, cervice antica crisoque pallide rufis: rostro nigro.*

Long. tota 8·0, alæ 4·0, caudæ 3·7.

*Hab.* Cayenne (*Poiteau* in Mus. Paris.); British Guiana (*Schomb.*); Bogota (*Mus. Brit.*); East Peru, wood-region (*Tsch.*); Pintobamba (*Cast. et Dev.*); Bolivia, Yuracares (*d'Orb.*); Brazil, Rio (*P. Max.*).  
*Mus. Brit.*, Paris., &c.

This *Saltator* seems very widely distributed over the South American continent, and is in that respect different from the rest of its congeners. It may be at once distinguished by its uniform bright olive-green upper plumage (not of so yellowish a tint as in *Saltator atriceps*), and the brownish blotch on the foreneck: from *S. magnoides* it differs in the want of the black throat-band.

The Brazilian skins are of rather larger dimensions than the Cayenne birds, but do not otherwise differ.

### 4. SALTATOR ICTEROHYGIUS.

*Saltator icteropyga*, Dubus, Esq. Orn. pl. 13; Gray, Gen. App. p. 16.

*Supra saturate cinerascenti-fuscus: superciliis, mento et gutture albis: pectore et epigastrio fulvescenti-cinereis: ventre dilute fulvo: hypochondriis cinereo-fulvis: crasso citrino: remigibus fuscis, extus cinereo limbatis: rectricibus supra nigris viridi-aneo submicantibus cinereoque extus limbatis: lateralibus quatuor utrinque macula magna alba in medio pogonii interni notatis: rostro corneo: pedibus fuscescentibus.*

*Hab.* Mexico.

The Vicomte Dubus has given the above description of this curious *Saltator*, of which there is a specimen in his collection. Prince

*pf 71*

Bonaparte, in his 'Conspectus,' states, on the authority of Baron de Lafresnaye, that it is merely the common *S. magnus* supplied with the tail of a *Ptilogonyx*. But Dr. Hartlaub, who has lately inspected the bird, is quite convinced of its being a good and distinct species. (See Journ. f. Orn. 1854, p. 255.)

### 5. SALTATOR SIMILIS.

*Tanagra superciliaris*, Max. Beitr. iii. 518?

*Saltator similis*, Lafr. et d'Orb. Syn. Av. i. p. 36; d'Orb. Voy. p. 290, pl. 28, fig. 2; Gray, Gen. p. 363; Tsch. F. P. p. 209?; Bp. Conspl. p. 489; Cab. Mus. Hein. p. 143.

*Saltator gutturalis*, Licht. in Mus. Berol.

*Supra cinereus; interscapulio et alarum marginibus olivaceo-viridibus: superciliis longis albis: subtus albido-cinerascens, medialiter fulvo tinctus: gutture toto pure albo, utrinque nigro marginato: crissō rufescente: rostri inferioris basi alba.*

Long. tota 9·0, alæ 4·0, caudæ 4·0.

Hab. South Brazil, Corrientes (d'Orb.); Peru, wood-region and coast (Tsch.).

Mus. Paris., Brit.

This bird is common among the collections of Brazilian skins so frequently imported of late years. Comparing it with *S. magnus*, we find the olive colour, which there pervades the entire upper surface, confined in the present species to the middle of the back and edgings of the wings, the rest of the upper plumage being cinereous. The throat too is pure white, and wants the rufous blotch on the fore-neck.

### 6. SALTATOR OLIVASCENS.

*Saltator olivascens*, Cab. in Schomb. Reise, iii. 676; Bp. Conspl. p. 490; Cab. Mus. Hein. p. 142.

*Saltator plumbeus*, Bp. Notes Orn. p. 23.

*Fusco-cinereus unicolor; superciliis ante oculos curtis et gutture albis, hoc utrinque nigro marginato: subtus albo-cinereus, pectore cinerascentiore; ventre medio albescentiore, inferiore cum crissō pallide rufescenti-ochraceis: rostro nigro.*

Long. tota 8·0, alæ 3·75, caudæ 3·3.

Hab. British Guiana (Schomb.); Cayenne (Mus. Paris.); Venezuela, Cumana (Mus. Eytoni); S. Martha (Bp.); Trinidad (Lord Harris).

Mus. Bremensi; Eytoni; Berolin.; Heineano.

There is no trace of green colour on the plumage of this *Saltator*, the upper surface being uniform blackish-cinereous, as in *Saltator grandis*, to which it is very closely allied. But the latter bird may be distinguished by the blacker sides of the head and ear-coverts, and the greater breadth of the stripes on each side of the throat, which leave only a narrow longitudinal white band in the middle of it. And in the Central American bird the ochraceous colour of the crissum extends all over the abdomen more or less, while in the present species the middle of the belly is nearly white.

*p 72*  
I have Prince Bonaparte's type of *S. plumbeus* in my possession, and consider it clearly the same as Dr. Cabanis' species.

#### 7. SALTATOR GRANDIS.

*Tanagra grandis*, Licht. Preis-Verz. no. 67 (1831).

*Saltator rufiventris*, Vig. Beechey's Voy. Pac. p. 19?

*Saltator vigorsi*, Gray, Gen. p. 363?; Bp. Conspl. p. 489; Cab. Mus. Hein. p. 143; Bp. Notes Orn. p. 23.

*Saltator icterophrys*, Lafr. Rev. Zool. 1844, p. 40; Gray's Gen. App. p. 16; Bp. Conspl. p. 490 (juv.?)??

*Saltator grandis*, Licht. in Mus. Berol.

*Saltator nigrigenis*, Sclater, MS.

*Supra nigrescenti-cinereus, lateribus capitinis nigris: superciliis albis: gutturis stria mediali alba, utrinque late nigro marginata: abdomine cinereo fulvo tincto: ventre imo et crasso rufescens.*  
*Junior (S. ICTEROPHYS, Lafr.?). Supra olivaceo indutus, superciliis et camptorio flavidis: ventre rufescens.*

Long. tota 7·75, alæ 4·0, caudæ 4·0.

Hab. South Mexico, Jalapa (*Mus. Berol.*); Orizaba (*Boteri*); vic. of Cordova (*Salle*); Guatemala (*Constancia*).

I have already stated the characters which distinguish this species from the preceding, which is its representative in the more northern portions of the South American continent, while *S. azarae* seems to take its place in Bolivia.

I am glad to be able to adopt Lichtenstein's name for the present bird, because I can only very doubtfully refer the other synonyms to this species, and in this state of uncertainty have occasionally applied to it the MS. name *nigrigenis*. But since I have seen the types of *S. grandis* at Berlin, and have ascertained that they are really the same as my *nigrigenis*, I have adopted Lichtenstein's name, which was published, although with rather insufficient specific characters, in 1831.

#### 8. SALTATOR MUTUS.

*Tanagra superciliaris*, Spix, Av. Bras. ii. 44, pl. 57?

*Saltator superciliaris*, Cab. Mus. Hein. p. 142, certe.

*Mus. Berol.*

The description and figure given by Spix of his *S. superciliaris* are as applicable to this species as any other; but without examining the type (which I vainly sought for the last time I was at Munich), it is impossible to be sure of being right in using his name for the present

p. 73

bird, and I have therefore adopted for it Lichtenstein's term *mutus*, by which it is known in the Berlin museum. In fact, the names *superciliaris* and *cærulescens* have been applied to so many of this group of species, and the original descriptions upon which these terms rest are so indefinite, that it only produces further confusion to continue to employ them.

The *Saltator mutus* is rare in collections. Besides the example at Berlin I have only seen the specimens collected by Mr. Wallace in the neighbourhood of Para, from one of which my characters are taken. It is distinguished from all its allies by the uniform blackish-gray colouring of the plumage, the same below as above, only much lighter and more white, without any tinge of green, brown or rufous, except on the crissum. The supercilia only extend to the top of the eye. The bill is deep black and more elongated than in its congeners.

#### 9. SALTATOR AZARÆ.

*Saltator azaræ*, d'Orb. Voy. p. 287: Bp. Conspl. p. 490.

*Supra nigricanti-cinereus, dorso virescente tincto: alis nigricantibus cinereo limbatis: superciliis curvis et gutture medio albis, hoc anguste nigro marginato: abdomine summo albescente, cinereo et ochraceo tincto, imo autem cinnamomescenti-ochraceo.*

Long. tota 9·0, alæ 4·3, caudæ 4·3.

Hab. Bolivia, prov. Moxos and S. Cruz de la Sierra (d'Orb.).

Mus. Brit., Paris.

The closest allies of this bird are certainly *S. grandis* and *olivascens*, particularly the latter; but it is larger than either of them. From *S. olivascens* it may be also known by its cinereous back, having rather a greenish than a brownish tinge, and a deeper cinnamomeous colouring extending from the vent up to the middle of the belly, which in the *S. olivascens* is nearly white. From *S. grandis* it differs in its shorter bill and narrow throat-stripes, besides its superior size.

Hab. Paraguay (Azara); Corrientes in rep. Arg. (d'Orb.).

Mus. Parisiensi.

I have only seen one specimen of this species, which is in the Paris Museum, and was brought by d'Orbigny from Corrientes. It is certainly very closely allied to the Bolivian '*azaræ*.' But the bill is shorter and thicker, and there is a greenish colouring on the back

*p. 79*  
and wings, of which there are no traces in the other bird, though I have some doubt whether this may not be due to the individual not being fully adult.

#### 11. SALTATOR GULARIS.

*Hab.* Monte Video (Cab.).

*Mus.* Berol.

I examined the type of this species when at Berlin, and was rather doubtful about its real distinctness from the preceding. I possess a specimen very much resembling it, as far as I can recollect and can gather from Cabanis' description. The bill of this example is not thicker than in one specimen of *S. gularis*, but is uniform black, and the back and wings are olive-green as in that in the Berlin Museum. But I think it is probable that this may be an immature stage of *S. gularis*.

*Saltator rufiventris*, Lafr. et d'Orb. Syn. Av. in Mag. de Zool. 1837, p. 35; d'Orb. Voy. p. 289, pl. 28, fig. 1; Gray's Gen. p. 363; Bp. Conspl. p. 489.

Long. tota 9·0, alæ 4·4, caudæ 4·0.

*Mus.* Brit. et Paris.

M. d'Orbigny found this species very common in the environs of Enquisivi, in the province of Sicasica, and near Palca, in the province of Ayupaya in Bolivia. Mr. Bridges' specimens in the British Museum are also from Bolivia. It is a well-marked bird, and not likely to be confounded with any of its congeners.

#### 14. SALTATOR AURANTIROSTRIS.

*Habia pico naranjado*, Azara, Pax. i. p. 349.

p. 75

*Saltator aurantiorostris*, Vieill. N. D. d'H. N. xiv. p. 103, et Enc. Méth. p. 789; d'Orb. et Lafr. Syn. Av. in Mag. de Zool. 1837, p. 35; d'Orb. Voy. p. 288; Gray, Gen. p. 363; Bp. Conspl. p. 490.

*Supra cinereus, pileo obscuriore : capitis lateribus, vitta subgutturali conjunctis, nigris : superciliis postice dilatatis et gutture albis : ab domine ochraceo-albido : cauda nigra, rectricibus lateralibus albo terminatis : rostro aurantio.*

Long. tota 8·5, alæ 4·0, caudæ 3·75.

Hab. Paraguay (Azara); Corrientes, La Plata (d'Orb.); Bolivia, Sicasica, Mizque, Valle-grande, Ayupaya, Cochabamba and La Paz (d'Orb.); Peru, Echarate (Cast. et Dev.).

Mus. Brit., Paris. &c.

This species, which may be always recognized by its bright orange bill, seems rather variable in some respects. There is a fine series of specimens of it in the Paris Museum, collected by d'Orbigny and Castelnau and Deville. In what seem to be the fully adults, the front sides of the head, throat and breast, are all deep black, a post-superciliary stripe and middle of the throat only being white. Others, which I suppose are immature, have the white space on the throat much larger, the black guttural band being confined to a mere ring, which in some specimens is hardly apparent.

#### 15. *SALTATOR ALBICOLLIS.*

*Saltator albicollis*, Vieill. N. D. d'H. N. xiv. 107, et Enc. Méth. p. 793; Gray, Gen. p. 363; Bp. Conspl. p. 489.

*Fusco-olivaceus ; subtus albo-subvirescens fusco maculatus : superciliis gulaque albidis.* (Bp.)

I have examined the type-specimen at Paris upon which Vieillot founded this species, and from which Prince Bonaparte took the short characters above given. It seems to be an immature bird, and I think the locality, Cayenne, is most likely wrong. I suspect it was probably from Trinidad, in which island there is a *Saltator* belonging to this section with the flammulated under-plumage. Of this I possess an example which may be described as follows:—

" Above greenish-olive ; head darker, uropygium more cinereous ; small yellowish supercilia before the eye ; wings bordered with bright olive-green ; tail brown like the wing-feathers inside, rectrices edged basally with cinereous ; under-surface white, regularly flammulated with olive-green, middle of the throat and belly nearly all white, just the shafts of the feathers only being olive ; under wing-coverts white ; bill black, with the apex yellow. Whole length 7·5; wing 3·5, tail 3·3."

There is a peculiar twist in the commissure in this bird which seems to agree with what Vieillot says of his *S. albicollis*; and I think it very probable that it is this Trinidad species that ought to bear that name.

But until an accurate comparison can be made between a series of individuals of each of the five members of this section of the genus, I think it almost hopeless to determine the species satisfactorily.

M. de Lafresnaye says of this species, that it differs from the preceding by its smaller size, grey and not olive tinge on the head and neck, belly white and not washed with olive, and beak shorter and yellow at the point.

The Guiana *Cissopis* is rather smaller than the common Brazilian species, and the steel-black colour does not extend so far down the back. The Paris Museum specimen of this bird seems to want the white wing-spots. I am not confident as to the correctness of separating this and the Brazilian bird.

## 3. CISSOPIS MINOR.

*Saltator bicolor*, Lafr. et d'Orb. Syn. Av. in Mag. de Zool. 1837, p. 36 ?

*Bethylus picatus*, d'Orb. Voy. p. 269 ? ; Tsch. Wieg. Archiv, 1844, p. 288.

Hab. Bolivia, Yuracares (d'Orb.) ; Eastern wood-region of Peru (Tsch.) ; New Grenada, Bogota.

Mus. Brit., Paris.

The Bogota *Cissopis* seems distinct from the Brazilian, having merely the upper neck steel-black, and the back all white. I am not quite certain whether d'Orbigny's Bolivian examples are best referable here. They seem to come pretty near the Cayenne bird.

### Genus VIII. OREOTHRAUPIS.

*Rostrum validum, tomiis mandibulae superioris medio turgidis et mandibulam inferiorem tegentibus, sicut in genere Lanione, sed brevius, altius, latius et medio minus uncinatum: alae breves, rotundatae: cauda sicut in genere Arremone.*

Long. tota 7·25, alæ 3·2, caudæ 3·5.

*Hab.* Andes in the vicinity of Quito (*Jameson*).

*Mus.* Gul. Jardine, Baronetti.

This peculiar Tanager in style of plumage and general habit corresponds most closely with the members of the genus *Arremon*, but the bill is altogether abnormal, the upper mandible swelling in the middle and overlapping the under, as in the genus *Lanio*, though not developed into a decided hook: but it is much shorter, broader and deeper than in the last-named genus, and has more general resemblance to that of some of the *Saltatores*.

### Genus IX. ARREMON.

*Arremon*, Vieill. Analyse (1816), p. 32.

The Brazilian specimens of this bird are slightly larger in size than those from Cayenne, and of rather a more yellowish green on the back. This species may be distinguished from all its nearest allies by its black bill.

This Bolivian species comes nearest to *A. flavirostris*, but there is more black on the upper mandible, and the superciliary stripes begin from the front, as in *A. silens*.

This bird is intermediate between *A. flavirostris* and *A. polionotus*. Unlike the latter, it has the whole upper mandible black and the back tinged with olive, and is besides of smaller size, and possesses a vertical band. From the former it appears distinguishable by its differently coloured bill and less olivaceous back.

This species may be distinguished from the *A. silens* by its cinerous back, narrower throat-band and differently coloured bill.

I have had a specimen of this bird in my possession for some time, but only lately discovered its distinctness from the preceding species, on comparing them together at the Jardin des Plantes. The Venezuelan form may be distinguished by the brown colour on the flanks and crissum, the brownish olive tail, and the commencement of the supercilia from the front. The examples of this *Buarremón* at Paris were sent to the Museum from Caraccas by M. Levraud.

Hab. Mexico (*Lafr.*); Guatimala; Bogota; East Peru (*Tsch.*); Venezuela, Caraccas.

Mus. Brit., Paris.

I have seen the type of *B. xanthogenys* in Herr Heine's beautiful collection of birds at Halberstadt. I think it is only an accidental variety of the *B. brunneinuchus*, because other examples from the same locality—Caraccas—seem perfectly identical with New Grenadian specimens.

M. DuBus considers this bird, which has been generally considered as the same as the Bolivian *rufinuchus*, distinct from that species. The principal difference apparent from d'Orbigny's figure seems to be the want of the lateral gular stripes, but I have seen indications of these in some Quitian specimens.

This bird very closely resembles the *B. semirufus* in colour, but has the lores, middle of the throat, rictal striæ and breast yellow, the chestnut occupying the sides of the throat and dividing it from the striæ. The bill is rather more finch-like than in the former species.

This group forms a series, the first members of which are closely allied to the *Buarremones*, and have the bill nearly as strong, and of the same form as in that genus. But they grow gradually more tenuirostral, and ultimately show striking affinities towards *Trichas* and other forms of the *Mniotiltinae*, with which they might at first sight be easily confounded.

This South American species may be distinguished from the Mexican *C. ophthalmicus* by its rather brighter olive colour above, its lores and throat tinged with fulvous-brown (in the other bird these parts are nearly pure white), and the fulvous-yellow breast, which in *C. ophthalmicus* is greenish yellow like the sides.

Prince Bonaparte's *Hemispingus veneris*, of which the type is in the Paris Museum, seems to me to be the same as this bird. It is certainly very closely allied to the common *C. flavipectus*, but I have no doubt it is really a distinct species.

### 5. CHLOROSPINGUS OLIVACEUS.

*Poospiza ! olivacea*, Bp. Consp. Av. p. 473.

*Chlorospingus olivaceus*, Sclater, Tan. Cat. Sp. p. 6.

*Hab.* Central America ?

*Mus.* Paris.

This bird is of exactly the same cast of plumage as *C. flavipectus* and *canigularis*, but may be distinguished by the colouring of its head, which has a broad longitudinal paler band, and is darker, almost black, over the eyes and again beneath them, and by the white postocular spot. A specimen in my possession seems to be of Delattre's preparation, and agrees with that in the Paris Museum, upon which Prince Bonaparte established his *Poospiza olivacea*.

#### 6. CHLOROSPINGUS FLAVIVENTRIS, sp. nov.

*Olivaceus ; capite cinereo, viridi paulum apparente ; gula albescenti-cinerea : abdomine toto flavo : rostro nigro, mandibula inferioris basi albescente.*

*Hab.* Trinidad (*Mus. Jard.*) ; Bolivia ? (*Mus. H. E. S.*).

I have seen two specimens of this apparently unrecognized *Chlorospingus*, which agrees in form with the preceding species, but is distinguished by its wholly yellow abdomen. One of these specimens is in Sir William Jardine's possession, the other in the collection of the late Mr. H. E. Strickland.

This little species, of which there are two examples in the British Museum, both apparently Bogota skins, differs from all its congeners in the colouring of the lower surface of the body, which is of a pale reddish buff, growing much whiter in the middle of the belly. Above the plumage is lead-coloured, with a greenish tinge superinduced towards the lower part of the back. The wings and tail are brown, with slight greenish edgings; the ear-coverts and whole side of the face are black. In the second specimen, apparently not so mature, there is a light-coloured spot on the front, just above the nostrils. The bill of this species agrees with that of *Chlorospingus atripileus* in size, but is rather straighter in form, as in *C. verticalis*.

Three specimens of what would at first sight appear to be *N. guira*, in my possession, two of which are from New Grenada and the third from Peru, offer such a marked difference in the length of the wing on comparison with specimens from the eastern coast, that I cannot avoid separating them specifically. They are also distinguishable, as the yellow colour is more developed on the sides of the neck, but does not form a band between the breast and black throat, as in *N. guira*. And in the *N. guirina* the breast has more of a deep chestnut tinge, which extends quite up to the black throat.

Perhaps d'Orbigny's Bolivian *N. guira* may be rather referable to this species than to the previous bird.

I possess three specimens of this *Nemosia*, male, female and young male, out of a collection formed, I believe, in the southern part of Brazil. This seems one of the most common and widely distributed species of birds in Cisandean South America. There is some variation in the length and thickness of the bill, and amount of white on the wings. Prince Bonaparte has named a Venezuelan bird exhibiting some differences in these respects, *Tachyphonus beauperthuui*, but I have not recognized that species as distinct, because I have observed such differences in specimens brought from the same locality.

Hab. Brazil (?) (Spix) ; Cayenne ; Surinam (Mus. Senckenb.).

*Mus.* Senckenb. et P. L. S.

This seems to be the species of this curious form which has the crest most developed, and from its locality the most likely to be what Spix intended by his *Tanagra penicillata*.

I have seen several examples of it, which I have no doubt from their preparation were Cayenne skins.

*Hab.* New Grenada, S. Martha (*Verreaux*) ; Cartagena et Caracas (*Mus. Paris.*) ; Nicaragua (Delattre).

*Mus.* Paris.

This bird seems to differ from the one I have called *penicillata* in its shorter crest, which is not white at the base, darker cinereous throat, rather more yellowish belly and blacker bill. In my list of Bogota birds I called it *penicillata*, not having then noticed its apparent distinctness.

This bird is rather smaller than the South Brazilian species, and may be distinguished from it by its brighter and more rosy colouring below, shorter tail and paler feet. I have only seen specimens from the island of Trinidad.

*Saltator rubicoides*, Lafr. R. Z. 1844, p. 41.

*Mus.* Brit., Berol., Lafresnayano, H.E.S.

This bird may be recognized by its tail being of the same colour as the back, not brighter, as in the Brazilian species, and the scarlet breast. My examples were collected by Signor Constancia in the vicinity of Guatimala. Specimens received by MM. Verreaux from S. Martha, New Grenada, to which I have seen the MS. name “*P. erythrolaimus*, Bp.” attached, appear hardly different from the Mexican bird.

## 4. PHÆNICOTHRUPIST GUTTURALIS.

Long. tota 9·3, alæ 5·5, caudæ 4·0.

Hab. New Grenada, Bogota (Lewy); S. Martha (Fontanier).

Mus. Brit., Paris.

Some examples of this splendid bird have the throat much more red, almost scarlet. I have not yet seen the female, which would probably have the throat black.

#### Genus XXII. ORTHOGONYNS.

*Cyanicterus*, Bp. Conspl. p. 240 (1850).

Long. tota 8·0, alæ 3·7, caudæ 3·5.

*Hab.* South Brazil, Rio (Spix).

*Mus.* Brit., Paris., &c.

I have seen many examples of this bird, all similar, from Brazilian collections, and therefore conclude the sexes are alike, although the colouring is what one would suppose to be that of a female bird.

### 2. ORTHOGONYX CYANICTERUS.

Long. tota 7·75, alæ 3·5.

*Hab.* Cayenne (Poiteau, 1822, *Mus. Par.*).

*Mus.* Brit., Paris., Lugdunensi, Lafresnayano.

There are pairs of this singular Tanager (marked ♂ and ♀) in the Paris, British, and Leyden Museums, but I have rarely met with it elsewhere. I consider it certainly congeneric with the Brazilian *O. viridis*. The only question is, whether that may not be the female of a corresponding brightly-coloured species. I may observe, that if the birds had not been marked as pairs in the collections above-cited, I should probably have considered the female as specifically distinct.

This bird is clearly distinct from the North American *P. aestiva* upon an accurate comparison. It is of quite a different red, being much brighter; the bill is larger and of a dark plumbeous, not horn colour, and the feet are nearly black.

As I find that Spix's *T. saira*, of which I have seen the type at Munich, is the female of this bird, I have thought it right to use that name for it, as first given, instead of the usually adopted *azaræ*.

This Mexican species is quite different from the *saira* and *estiva*, being larger in size and greyish-red above. I have never observed it except in collections from Mexico. I think the *P. azaræ*, noticed in Sitgreaves' 'Report of the Zuni and Colorado Rivers Expedition,' is very likely to be this bird, as the *saira* (*azaræ*) does not range nearly so far north.

This South American bird has not the black front and chin of the Mexican *P. erythromelana*, with which it is generally united, and has less appearances of black between the wings. If these differences are constant, as they appear to be in all the specimens which I have access to at present, the two species may be rightly regarded as distinct.

Lafresnaye gives no locality for his *P. bivittata*, but his description is rather more applicable to the Mexican bird, and Tschudi's 'ardens' seems the only term left for the South American form.

I have two Bogota skins of this bird. It comes very close to *R. jacapa*, of which it is doubtless the New Grenadian representative. But it is of the same dark sanguineous purple above as below, while *R. jacapa* has the back almost black, just glossed with that colour. Its bill is of the same size as in the *jacapa*, but the base of the lower mandible is not so bright.

#### 6. RAMPHOCELUS MAGNIROSTRIS.

*Ramphocelus magnirostris*, Lafr. R. Z. 1853, p. 243.

*Similis R. jacapæ, sed crassitie paulo majore, rostro majore, longiore, et colore pectoris clariore differt.*

*Mus.* Brit.

I have seen many examples of this bird from the island of Trinidad. It certainly seems to have the beak always larger than the Cayenne bird, but this feature varies a little, some individuals being particularly remarkable for the size of the beak. The breast is also rather brighter than in *R. jacapa*.

I have in my care at present the type of *R. uropygialis*. It is the property of Mr. Edward Wilson, and will eventually, I believe, go to the Museum of the Academy of Natural Sciences at Philadelphia. I have never seen a second specimen.

*Hab.* Bolivia (*d'Orb.*); East Peru (*Tsch.*).

I have seen several specimens, clearly showing by their intermediate plumage that Lafresnaye's *R. aterrimus* is nothing more than the present bird in its immature state.

This species may be at once distinguished from *R. flammigerus*, with which it has been generally confounded, by its smaller size.

*Velutino-niger*: *dorso postico toto aurantiaco-flavo*.

*Hab.* New Grenada, Juntas (Delattre).

This orange-rumped bird is scarcer than the other two species, *R. flammigerus* and *icteronotus*, which it so closely resembles; and I have some doubts as to its real distinctness from the former.

This is a smaller bird than the *S. nigriceps*, and has the lesser wing-coverts chestnut and not black. From the true *zena* it may be distinguished by its smaller bill, the more extended and brighter yellow colour on the belly, and by its having the whole back of the neck bright yellow, not dark chestnut.

The *T. episcopus* of Linnæus depends upon Brisson's '*Episcopus avis*' and from Brisson's description and locality I think there can be little doubt that the present species with white shoulders and narrow edgings to the greater coverts was intended.

The only bird likely to be confounded with it is the next following species *T. cœlestis*, which has a regular *white bar* across the wings formed by the pure white terminations of the greater coverts.

These blue 'Bishop' Tanagers are very puzzling, and I confess I am as yet quite unable to arrange them satisfactorily. After separating the true '*episcopus*' and '*cælestis*' (which are clearly distinct) and the large South Brazilian '*cyanoptera*' (which may also be recognized without much difficulty), there remain four or five birds with different names attached to them varying a good deal in the amount of blue on the wings, but not otherwise presenting very appreciable differences. At present I am inclined to refer them to two species—a South American bird with the lesser wing-coverts of a more or less violet tint—and a Central American and Mexican species with these parts deep blue—like the South Brazilian *T. cyanoptera*. The former bird is common in collections from Bogota and Trinidad, and seems to range so far south as the Amazon at Para. The latter extends from the north coast of New Grenada through Central America as far north as the province of Vera Cruz, whence specimens have lately been brought by M. Sallé.

Prince Bonaparte, in his 'Note s. l. This is perhaps a local variety only of the common *T. palmarum*, presenting no green edgings to the primaries or secondaries beyond the green bar. I have birds from S. Martha, Trinidad and Bolivia, which seem intermediate between this and the former species.

I believe now that there is little doubt that the olive-backed bird named *T. darwini* by Prince Bonaparte, and afterwards *T. frugilegus* by Tschudi, is really the female of *T. striata*, though at one time I thought otherwise. I have not yet seen the black-backed male from the western side of the Andes; but d'Orbigny's Bolivian collection in the Paris Museum contains examples of both sexes from the eastern side.

If the birds from all the localities given are identical, which I believe to be the case, this *Tanager* presents an instance of a remarkably extensive geographic range for a bird of this family.

This is a common species in Bogota collections. In Gray's Genera and Prince Bonaparte's Conspectus it is erroneously united to *B. eximia*, from which it is quite distinct. Sir William Jardine possesses examples transmitted by Professor Jameson from the forests of the Andes near Quito, which are rather larger than Bogota skins, and have the bill stronger and are less black on the throat.

 blue edgings to the wings and tail, and the crissum is wholly red. In the present species the crissum is sometimes partly red, but I have never observed any traces of blue markings on the wings or tail.

This species and the next following are certainly not very typical *Iridornithes*, but without creating a new generic appellation for them, I hardly know at present where to place them more satisfactorily.

This Tanager was first well-distinguished from *C. flaviventris* of Cayenne by Prince Bonaparte, who proposed to retain for it the Linnaean name *mexicana*. This I cannot assent to, as the bird has nothing to do with Mexico; and moreover, if that name is used at all, it must be applied to the Cayenne bird, as Linnaeus's species was grounded principally on Brisson's *Tang. cayennensis cœrulea*.

The *Calliste vieilloti* is common in collections from Trinidad, and

*p. 256*  
may be readily recognized by its bright yellow belly and under wing-coverts, which in *C. flaviventris* are creamy white tinged with yellow.

This beautifully coloured bird, which was first discovered by Delattre in Veragua, has been generally supposed to be the same as the *C. larvata*, and it was only upon a close examination of the specimen lately procured by Mr. Bridges, and comparison of it with individuals of the other species, that I was enabled to recognize its difference. This *Calliste* is slightly smaller than the *larvata*, and has the head of a much lighter golden green, in some lights passing almost into pale green. In the other bird these parts are more of a coppery brown. In this species, also, the lower back and edgings of the middle and greater wing-coverts are of a much greener tinge, and there is more white in the middle of the belly and crissum.

This species, of which I have seen many examples in the most recently imported Bogota collections, is very closely allied to the *T. velia* of Cayenne ; but in the present bird the front lores and throat are of the same full blue as the wing-edgings, and there is no tinge of greenish colouring on the head as in its Cayenne representative. The whole colouring is also generally more intense, and the black collar on the throat is narrower and less defined.

This is the species figured by Desmarest and Vieillot as the true *musica*, and considered by me in my Synopsis of this genus, given in the 'Contributions to Ornithology' for 1851, to be that bird in an immature state. But on an examination of Desmarest's types in the Paris Museum, I agree with Prince Bonaparte (who has done me the honour to call this species *E. sclateri*) that it is apparently distinct.

A specimen of the female of this bird in the Derby Museum at Liverpool bears the label "*Tanagra flavifrons*, Latham;" and as Latham's description and Sparman's figure agree sufficiently well with it, and this specimen is probably the type of Latham's description, I feel bound to employ the term *flavifrons* as the first-given appellation of this *Euphonia*.

As however I think it possibly distinct from the *E. chlorotica* of Cayenne, MM. Lafresnaye and d'Orbigny's name can be retained for the Bolivian bird, until further examination of a series of specimens can be made—by which means only the question of their identity can be determined.

#### 7. EUPHONIA TRINITATIS.

*Euphonia trinitatis*, Strickl. Cont. Orn. 1851, p. 72 ; Slater, Cont. Orn. 1851, p. 84.

♂. *Atro-nitens sed magis viridescens quam E. chlorotica : capite et gutture purpureo tinctis : fronte angusta nigra : pileo supero toto postice rotundato et abdomine aureis : macula magna ovali in pogonio interno rectricum duarum utrinque extimarum et alis subtus albis.*

♀. *Supra olivascens : subtus flava.*

Long. tota 3·9, alæ 2·2, caudæ 1·3.

*Hab.* Trinidad.

*Mus.* P. L. S.

I have seen a good many examples of this Trinidad species, which appears correctly separable from the Cayenne bird.

#### 8. EUPHONIA AFFINIS.

*Tanagra (Euphonia) affinis*, Less. R. Z. 1842, p. 175.

*Euphonia affinis*, Gray, Gen. p. 367. sp. 20 ; Bp. Conspl. p. 233.

♂. *Atro-nitens : capite et gutture purpureo tinctis : fronte angusta nigra : pilei dimidio antico usque ad angulum oculorum extremum et abdomine toto limonaceo-flavis : macula magna in pogonio externo rectricum duarum utrinque extimarum et alis subtus albis.*

. *Supra olivascens, pileo postico et dorso superiore cinereo tinctis : subtus flavescentior, abdomine medio clarior.*

Long. tota 3·0, alæ 2·1, caudæ 1·3.

*Hab.* S. Mexico, Orizaba (*Botteri*) ; Guatimala ; Realejo, Central America (Less.).

*Mus.* P. L. S.

In the amount of yellow on the head, and general appearance, this species comes very near the true *chlorotica*. But it may be recognized by the paler tinge of the yellow and the absence of the violaceous colouring upon the back.

#### 9. EUPHONIA MINUTA.

*Euphonia olivacea*, Desm. Tan. pl. 27 ; Gray, Gen. p. 367. sp. 2 ; Bp. Conspl. p. 232 (♀) ?

*Tanagra olivacea*, Vieill. Ene. Méth. p. 782.

*Euphonia pumila*, Bp. R. Z. 1851, p. 136; Note s. l. Tang. p. 10.

*Euphonia leucopyga*, Natt. in Mus. Vindob.

*Atro-nitens*; *dorso viridescentiore, capite et gutture purpurascen-*

*cum trium utrinque extimarum pogonio interno fere toto cum*  
*tectricibus alarum inferioribus albis.*

♀. *Supra olivacea: subtus flavescens, abdomine medio grisescente.*

Long. tota 3·4, alæ 1·9, caudæ 1·0.

*Hab.* Cayenne; Brit. Guiana (Schomb.); Barra do Rio Negro (Natt.); New Grenada, Bogota.

*Mus.* Brit., Vindob.

This species is very easily distinguished among its close affines by the narrow yellow head-band and white crissum.

I have seen the type of Cabanis' *E. minuta*, and have no doubt it is the female of this bird, the male of which was afterwards named by Prince Bonaparte and Mr. Strickland almost simultaneously.

I have little doubt that Desmarest's *Euphonia olivacea* is also the female of this bird, but the name is hardly sufficiently applicable to warrant its adoption.

#### 10. EUPHONIA CONCINNA.

*Euphonia concinna*, Sclater, P. Z. S. 1854, p. 98. pl. 85. fig. 2, et 1855, p. 159; Tan. Cat. Sp. App. p. 16.

*Euphonia hirundinacea*, Bp. R. Z. 1851, p. 156; Note s. l. Tang. p. 10?

Long. tota 4·0, alæ 2·4, caudæ 1·3.

*Hab.* Southern Brazil; Ecuador, prov. Quixos; New Grenada, Bogota.

*Mus.* Brit.

*b.276*

I can find no difference between the Brazilian bird and the Bogota specimens (*E. brevirostris*) sufficient to warrant their separation.

#### 12. EUPHONIA RUFICEPS.

*Euphonia ruficeps*, Lafr. et d'Orb. Syn. Av. in Mag. de Zool. 1837, p. 30; d'Orb. Voy. p. 268. pl. 22. fig. 2; Gray, Gen. p. 367. sp. 18; Bp. Conspl. p. 232; R. Z. 1851, p. 136; Note s. l. Tang. p. 10; Sclater, Contr. Orn. 1851, p. 85.

*Nitenti-cærulescenti-nigra, cervice postica intense violacea: gutture nigro: pileo summo cum fronte castaneis: abdomine aureo medialiter aurantiaco: macula in pogonio externo rectricis una& utrinque extima et tectricibus subalaribus albis.*

Long. tota 4·0, alæ 2·4, caudæ 1·2.

Hab. Bolivia, Yuracares (d'Orb.); Venezuela, Caraccas (Levraud).

*Mus. Parisiensi, Lafresnayano, Derbiano.*

A bird in the collection lately transmitted to the Paris Museum by M. Levraud from Caraccas, differs from the true Bolivian *ruficeps* only in having rather more chestnut colouring on the head, and that of a lighter and more orange-coloured tinge. I should be unwilling to separate it specifically without seeing more specimens.

#### 13. EUPHONIA FULVICRISSEA, sp. nov.

*Supra nitenti-æneo-nigra, pileo postice rotundato flavo: gutture toto cum cervice versus ventrem in semicirculum terminata æneo-nigris: abdomine aureo, medialiter aurantiaco: crisco fulvo: rectricis una& utrinque extima macula in pogonio externo et tectricibus subalaribus albis; his flavescente tinctis.*

Long. tota 3·7, alæ 2·0, caudæ 1·2.

Hab. S. Martha in New Grenada.

I possess a single specimen of this *Euphonia* which was received by MM. Verreaux from their collector at S. Martha. It appears to me to constitute a new species of this genus, distinguished by the way in which the black throat is produced towards the breast and rounded at its termination, and the peculiar colour of the crissum.

#### 14. EUPHONIA CHALYBEA.

*Tanagra chalybea*, Mikan, Faun. et Flor. Bras. pl. 3. fig. 1 ♂, 2 ♀.

### 17. EUPHONIA CRASSIROSTRIS, sp. nov.

*Euphonia fortirostris*, Lafr. in Mus. suo?

*Nitenti-cæruleo-nigra, nucha vix violaceo tincta : pileo summo postice rotundato flavo : linea angusta supra oculos et narium plumis nigris : subtus læte flava : rectricum duarum utrinque extimarum macula longa in pogonio interno et tectricibus subalaribus albis : rostro fortis, crasso.*

♀. *Olivacea, subtus flava, lateribus olivascentibus.*

Long. tota 4'1, alæ 2'6, caudæ 1'6.

Hab. New Grenada, Bogota.

*p. 278*

I had formerly thought this Bogota bird might be the same as the Central American *E. hirundinacea*, but I have lately obtained other specimens, and find that such is not the case. The upper colouring of this bird is not of the peculiar green shade which exists in the true *hirundinacea*, and the yellow head, instead of being confined to the frontal half and terminated by a straight line, extends further back and is posteriorly rounded. The bill of this bird is also thicker, broader and stronger, and shows more approach to the true Bolivian *laniirostris*.

I am not now certain whether it is this species or the *hirundinacea* to which the Baron de la Fresnaye has given the MS. name *fortirostris*.

#### 18. EUPHONIA HIRUNDINACEA.

*Euphonia hirundinacea*, Bp. P. Z. S. 1837, p. 117; Gray, Gen. p. 367. sp. 4; Bp. Conspl. p. 232; Selater, P. Z. S. 1854, p. 98. pl. 85. fig. 1 (*fig. mala*).

*Euphonia laniirostris*, Selater, Contr. Orn. 1851, p. 86.

*Viridescenti-aeneo-nigra, cervice postica carulescentiore: pileo a fronte ad initium oculorum et corpore subtus flavis, macula in ventre imo alba: rectricum duarum utrinque extimarum macula oblonga in pogonio interno et tectricibus subalaribus albis.*

Long. tota 4·2, alæ 2·5, caudæ 1·3.

*Hab.* Guatimala (Bp. et Constancia); S. Mexico, Cordova (Sallé).

I had not very good specimens of this bird when I described it in P. Z. S. for 1854, and the figure there given would suit better my *Euphonia crassirostris*. M. Sallé, however, has lately brought some beautifully prepared skins from Southern Mexico, which have enabled me to determine the species more satisfactorily.

I have seen specimens in which the white belly-spot, which is perhaps produced by abrasion of the feathers in the most adult birds, was scarcely apparent.

#### 19. EUPHONIA MELANURA.

*Euphonia melanura*, Selater, Contr. Orn. 1851, p. 86; P. Z. S. 1855, p. 159.

*Nitenti-violaceo-nigra: pileo summo cum fronte et corpore subtus aureis: rectricibus immaculate nigris.*

Long. tota 4·0, alæ 2·3, caudæ 1·3.

*Hab.* Barra do Rio Negro (Wallace); New Grenada, Bogota?

The Bogota birds have the bill rather stronger and the yellow on the head more extended than the specimens from the Amazons.
