1971. Discount Value and Time Sequence of Fellings.

— ACTA FORESTALIA FENNICA 119. 58 p. Helsinki.

The aim of the study is to discover a model by which the determination of the discount value of a woodlot can be simplified so as to make it possible to avoid both the computation of a cutting budget and the customary discount procedure itself. The regression analysis of the cutting budget data that indicates the discounted amount of the fellings to be expected and the assortment composition can be discovered rather accurately as a function of the measured stand characteristics only.
