

SECONDARY RETINAL DETACHMENT IN ULTRASONOGRAPHY AND COMPUTED
TOMOGRAPHY

J. Szymczak

Military Institute of Aviation Medicine, Warsaw

12 patients with secondary retinal detachment were examined. In order to determine a proper diagnosis besides routine check ultrasonographic tests were carried out using A - scan and B - scan methods.

In cases when second retinal detachment was found /among 50 cases of retinal detachment examined/ computerized tomography was performed.

It was shown that using these two methods together allowed to give the right diagnosis for the presence of intraocular tumor in all cases. At the same time it was possible to determine lesion topography, its size and range in relation to the wall of the eyeball.

Particular usefulness of both methods of investigation was found in cases with opaque ocular media.
