**Abstract:** The paper presents information about the occurrence of digger wasps in the Pomeranian Lake District and on the Baltic Coast. Samples were collected from 1983 to 2016. The study yielded a total of 127 species (about 53% of Polish fauna) belonging to 35 genera; were recorded 22 species are new for the Baltic Coast and 2 are new for the Pomeranian Lake District. Also, 22 of the species identified are on the Red List of Threatened Animals in Poland: *Ammophila pubescens* Curtis, 1836, *Bembix rostrata* (Linnaeus, 1758), *Cerceris ruficornis* (Fabricius, 1793), *Crossocerus congener* (Dahlbom, 1845), *C. heydeni* Kohl, 1880, *C. pullulus* (A. Morawitz, 1866), *C. styrius* (Kohl, 1892), *C. tarsatus* (Shuckard, 1837), *Didineis lunicornis* (Fabricius, 1798), *Dolichurus corniculus* (Spinola, 1808), *Dryudella pinguis* (Dahlbom, 1832), *Ectemnius fossorius* (Linnaeus, 1758), *Gorytes fallax* Handlirsch, 1888, *Harpactus tumidus* (Panzer, 1801), *Lestica alata* (Panzer, 1797), *Mimumesa beaumonti* (van Lith, 1949), *Miscophus ater* Lepeletier, 1845, *Nysson niger* Chevrier, 1868, *Oxybelus variegatus* Wesmael, 1852, *Pemphredon austriaca* (Kohl, 1888), *Tachysphex fulvitarsis* A. Costa, 1867 and *T. psammobius* (Kohl, 1880).

**Key words:** Hymenoptera, Crabronidae, Sphecidae, new records, Eastern Pomerania, Northern Poland

### INTRODUCTION

In the world fauna, there are 10,007 species of digger wasps (Pulawski 2019), 241 of which are found in Poland (Olszewski et al. in press). These insects are morphologically diverse, with sizes ranging from 2 to 30 mm. All of those in the Polish fauna lead a solitary life. The majority of females hunt for insects or spiders as food for larvae, but there are some *Nysson* species that have lost their hunting instinct, becoming specialized in entering the nests of other species and laying their eggs on their host victims (Bohart & Menke 1976). Adult digger wasps feed mainly on nectar and aphid secretions, sometimes on their hosts. The distribution of digger wasps in Poland is very uneven. The latest faunistic research was conducted in the Baltic Coast (Ciechanowski et al. 2008, Kowalczyk 2006, Kowalczyk & Tward 2011) and Pomeranian Lakeland (Ciechanowski et al. 2001, Ciechanowski et al. 2004, Kowalczyk 2004). The data in the present paper provide information on the occurrence of digger wasps in the Pomeranian Lakeland and on the Baltic Coast collected by the second author in the years 1983–2016.

As in a previous paper on soldier flies (Diptera, Stratiomyidae) (Żóralski & Kowalczyk 2018), ‘Gdańsk Pomerania’ is here taken to be the area of the former Province of Gdańsk within its boundaries from 1957 to 1975. The first information on the occurrence of individual sphecid wasps in Pomerania is contained in Siebold (1839) and Brischke (1862, 1865, 1888); more accurate data from the late nineteenth century to World War II from the Pomeranian Lakeland are included in the papers by Lüderwaldt (1897), Müller (1918) and Paul (1941).

## MATERIAL AND METHODS

The material was obtained by sweeping with an entomological net in 1983–2016. The specimens are deposited in the authors' collections. The nomenclature and systematics in this work are consistent with W. J. Pulawski's Catalogue of Sphecidae 'sensu lato' (2019). The species within the two families are listed in alphabetical order. The information for each species is given as follows: locality/localities on the Baltic Coast and/or in the Pomeranian Lakeland; all the faunistic regions of Poland (Wiśniowski 2004, Olszewski et al. in press) in which the species has been recorded to date; first record(s) for the Baltic Coast and/or the Pomeranian Lakeland; red list status (Skibińska 2002). The material is deposited in the collection of the first author.

## RESULTS

A total of 127 species from the families Ampulicidae, Crabronidae and Sphecidae in Eastern Pomerania (Polish: Pomorze Gdańskie; German: Pomerellen). This makes up about 53% of the Polish fauna of these families.

Family: Ampulicidae Shuckard, 1840

### **1. *Dolichurus corniculus* (Spinola, 1808)**

Material examined: GAR, 27 Jul 1990 – 1♀, 21 Jul 1997 – 1♀, 27 Jun 1998 – 1♀, 27 VII 1999 – 1♀, leg. JKK.

Distribution in Poland: Baltic Coast, Bieszczady Mts, Eastern Sudety Mts, Kraków-Wieluń Upland, Lower Silesia, Małopolska Upland, Mazovian Lowland, Podlasie, Pomeranian Lakeland, Sandomierz Basin, Upper Silesia, Western Beskid Mts and Wielkopolska-Kujawy Lowland. Classified as near threatened (NT) on the Red List of Threatened Animals in Poland.

### CONCLUSIONS

The material collected in Gdańsk Pomerania over the last 33 years contained 127 species of digger wasps (Hymenoptera: Ampulicidae, Crabronidae and Sphecidae). Among them, 22 species new to the Baltic Coast were found, i.e.: *Ammophila pubescens*, *Astata minor*, *Crossocerus assimilis*, *C. congener*, *C. megacephalus*, *C. nigritus*, *C. varus*, *C. styrius*, *Gorytes fallax*, *G. quadrifasciatus*, *G. quinquecinctus*, *Mimesa bicolor*, *M. lutaria*, *Mimumesa dahlbomi*, *Miscophus ater*, *M. concolor*, *Nysson niger*, *Passaloecus singularis*, *Pemphredon lethifer*, *P. montana*, *Tachysphex psammobius* and *Trypoxylon minus* and 2 species new for the Pomeranian Lake District: *Cerceris ruficornis*, *Mimesa bruxellensis*.

The high fauna value of the studied area is evidenced by the fact that 22 species listed from there are on the Red List of Threatened Animals in Poland. These species are: *Ammophila pubescens*, *Bembix rostrata*, *Cerceris ruficornis*, *Crossocerus congener*, *C. heydeni*, *C. pullulus*, *C. styrius*, *C. tarsatus*, *Didineis lunicornis*, *Dolichurus corniculus*, *Dryudella pinguis*, *Ectemnius fossorius*, *Gorytes fallax*, *Harpactus tumidus*, *Lestica alata*, *Mimumesa beaumonti*, *Miscophus ater*, *Nysson niger*, *Oxybelus variegatus*, *Pemphredon austriaca*, *Tachysphex fulvitarsis* and *T. psammobius*.

## STRESZCZENIE

**[Materiały do poznania grzebaczowatych (Hymenoptera: Crabronidae, Sphecidae) na Pomorzu Gdańskim]**

W pracy przedstawiono informacje o występowaniu grzebaczowatych na Pojezierzu Pomorskim i na Pobrzeżu Bałtyku. Materiał zbierano w latach 1983–2016. W sumie wykazano 127 gatunków (około 53% gatunków znanych z Polski) należących do 35 (z 50 notowanych w Polsce) rodzajów.

W zebranym materiale stwierdzono 22 gatunki nowe dla Pobrzeża Bałtyku: *Ammophila pubescens*, *Astata minor*, *Crossocerus assimilis*, *C. congener*, *C. megacephalus*, *C. nigritus*, *C. varus*, *C. styrius*, *Gorytes fallax*, *G. quadrifasciatus*, *G. quinquecinctus*, *Mimesa bicolor*, *M. lutaria*, *Mimumesa dahlbomi*, *Miscophus ater*, *M. concolor*, *Nysson niger*, *Passaloecus singularis*, *Pemphredon lethifer*, *P. montana*, *Tachysphex psammobius* oraz *Trypoxylon minus* oraz 2 gatunki nowe dla Pojezierza Pomorskiego: *Cerceris ruficornis*, *Mimesa bruxellensis*.

O wysokich walorach faunistycznych badanego terenu świadczy fakt, że 22 wykazane stamtąd gatunki, tj. *Ammophila pubescens*, *Bembix rostrata*, *Cerceris ruficornis*, *Crossocerus congener*, *C. heydeni*, *C. pullulus*, *C. styrius*, *C. tarsatus*, *Didineis lunicornis*, *Dolichurus corniculus*, *Dryudella pinguis*, *Ectemnius fossorius*, *Gorytes fallax*, *Harpactus tumidus*, *Lestica alata*, *Mimumesa beaumonti*, *Miscophus ater*, *Nysson niger*, *Oxybelus variegatus*, *Pemphredon austriaca*, *Tachysphex fulvitarsis* oraz *T. psammobius* znajdują się na Czerwonej liście zwierząt ginących i zagrożonych w Polsce.
