

Acknowledgments

I would like to begin this volume by thanking my colleagues for their fine contributions to the project entitled “Vegetation of calamine soils and its importance for biodiversity and landscape conservation in post-mining areas”, and for the professionalism and commitment they showed in all their work. This large project, implemented in 2008–2011, was supported by Iceland, Liechtenstein and Norway through the Financial Mechanism of the European Economic Area (EEA FM PL0265).

Without their efforts in the field and in the laboratory, and without our discussions, both planned and spontaneous, we would not have fully achieved the objectives. I especially thank the researchers who carried out the field work regardless of the weather, collecting priceless data for the project and for further studies and publications. After completing the project and handing in a comprehensive report to the Polish Ministry of Science and Higher Education, we

decided to make one more effort and prepare a book-length volume of papers covering this ground. Here it is, made possible by the good working relationships and productive contacts we established during our investigations. To Professor Krystyna Grodzińska, my thanks for her careful reading of the individual chapters and correction of mistakes.

All of us in the project group are grateful to the authorities and staff of Olkusz County, Bolesław and Bukowno municipalities, the Bolesław Mining and Metallurgical Plant in Bukowno (ZGH Bolesław), and the Olkusz Forest District, for granting permission to do our research in areas under their administration, for sharing information, and for their kind assistance and their interest in the results of the work.
